Listing of Claims:

1. (Currently Amended) A method of combined source-channel decoding of digital data coding discrete values or symbols (i, j, etc.) received by [[a]] an input convolutional channel decoder (51) of a digital data <u>turbodecoder</u> decoder (50) from a source (10) over a transmission channel (40), <u>the method</u> comprising the steps of:

applying <u>a priori</u> probabilities (p(i), p(i/j)) associated with said symbols to a channel decoding trellis of said <u>input convolutional</u> channel decoder (51); and

statistically estimating, at each iteration of the turbo-decoder (50), said a priori probabilities from occurrences of the symbols estimated by said turbodecoder decoder (50).

- 2. (Cancelled).
- 3. (Currently Amended) The combined decoding method according to claim 1, wherein said a priori probabilities are probabilities (p(i)) of occurrences of the symbols.
- 4. (Currently Amended) The combined decoding method according to claim 1, wherein said a priori probabilities are probabilities (p(i/j)) of transitions between the symbols.
 - 5. (Cancelled).
 - 6. (Cancelled).

- 7. (Currently Amended) The combined decoding method according to claim 1, wherein said symbols are coded by variable length codes (VLC) represented by a binary tree of finite size and said a priori probabilities (p(i), p(i/j)) are associated with each branch of said tree and applied to the corresponding stages of said channel decoding trellis.
- 8. (Currently Amended) A combined source-channel <u>turbodecoder (50)</u> decoder for digital data, comprising:
- [[a]] <u>an input convolutional</u> channel decoder (51) adapted to receive digital data transmitted from a source (10) over a transmission channel (40) and coding discrete values or symbols (i, j, etc.) and <u>a priori</u> probabilities associated with said symbols;

an output convolutional channel decoder (51');

- a generator (54) of histograms of occurrences of the symbols estimated by the <u>output</u> convolutional channel decoder (51') [[(50)]];
- means (55) for calculating <u>said a priori</u> probabilities (p(i), p(i/j)) associated with said <u>estimated restored</u> symbols; and
- means (56) for applying said <u>a priori</u> probabilities to a channel decoder trellis of the <u>input</u> <u>convolutional</u> channel decoder (51).
- 9. (Currently Amended) The combined <u>turbodecoder</u> decoder according to claim 8, wherein said channel decoding trellis produces binary values ((0, 1) or (-1, 1) considering modulation) and said means for applying said <u>a priori</u> probabilities comprise a module (56) for converting symbol <u>a priori</u> probabilities (p(i), p(i/j)) into probabilities of binary values ((0, 1) or (-1, 1)).

- 10. (Currently Amended) The combined decoder according to claim 8, wherein said <u>a priori</u> probabilities are probabilities (p(i)) of occurrences of the symbols.
- 11. (Currently Amended) The combined decoder according to claim 8, wherein said \underline{a} priori probabilities are probabilities (p(i/j)) of transitions between the symbols.
 - 12. (Cancelled).
 - 13. (Cancelled).
- 14. (Currently Amended) The combined decoder according to claim 8, wherein said symbols are coded by variable length codes (VLC) represented by a binary tree of finite size and said <u>a priori</u> probabilities (p(i), p(i/j)) are associated with each branch of said tree and applied to the corresponding stages of said channel decoding trellis.
